

Edit and validate XSLT prior to OAI-Harvesting

Created By: Team Rosetta
Created on: 6/04/2019

The Library Service Center of North rhine-Westfalia provides a small toolbox to facilitate OAI Harvester Job configuration. The toolbox consists of an Java Class with JUNit Tests and some generic examples of XSLT for different Repository Software like ContentDM, Eprints or DSpace. Toolbox can be deployed and used by importing the Maven project from github into Eclipse.

Idea of the toolbox is to facilitate XSLT configuration by providing a simple method to edit and validate your XSLT outside of Rosetta. It does not replace the XSLT checks within Rosetta but makes XSLT editing a little bit more comfortable.

Toolbox can be checked out at: <https://github.com/hbz/rosetta-xsl-templates.git>
