

Configure Voyager Z39.50 to send UTF-8 encoded records

- **Product:** Voyager
 - **Relevant for Installation Type:** Multi-Tenant Direct, Dedicated-Direct, Local, TotalCare
-

Question

How to enable the Voyager Z39.50 Server to send UTF-8 encoded records.

Answer

By default, the Voyager Z39.50 Server sends MARC-8 encoded records to remote clients that request records via the Z39.50 protocol.

UTF-8 encoded records can also be provided by configuring the Z39.50 Server to handle UTF-8 encoded records *on a separate port*.

For instructions to implement this separate port configuration, see the [Technical User's Guide](#), Chapter 18.

Additional Information

Note that after upgrading Voyager you may need to re-implement these configuration changes.
