
New features in Global Data Change for Voyager 9.0

- **Product:** Voyager
 - **Product Version:** 9.0
 - **Relevant for Installation Type:** Multi-Tenant Direct, Dedicated-Direct, Local, TotalCare
-

Question

What changes were made in Global Data Change (GDC) for Voyager 9.0?

Answer

New GDC features in Voyager 9.0 include:

- Suppress/Unsuppress and SuppressAll/UnsuppressAll (Suppress and Unsuppress bibliographic and holdings records)
- Delete/DeleteAll (DeleteAll deletes all records in a hierarchy unless there are attachments, in that case it suppresses them)
- Match Job (Create a record set by matching MARC records in a file)
- Status in Preview (additional information for changes or issues)
- Export File of MARC Records (export files of MARC records from GDC)
- Export File of Record IDs (can be used to run MarcExport or Pick and Scan)
- Owning Library (limit records in set to include or exclude library; limit changes to records to specific library)

Subsequent versions of Voyager provide additional new features to GDC such as:

- Authority Control (process an authority file and prepare sets of records to be used to update authority records in Voyager)
- Copy Rules (copy existing rule to create a new rule)
- Update OK to Export (update the OK to Export flag)
- Change Owning Library (change the owning library)
- Sort Tags (sort MARC tags into user defined order)
- Create Record Set from a Range of Record IDs (create a record set from a range of record IDs)
- New rule conditions (MARC Field Exists and Does Not Have, MARC Field Value... Does not contains, MARC Field Value... Starts With, OPAC Suppress Flag is... Suppressed/Unsuppressed)
- Insert new subfields in specified order
