

"Skip location" button appearing although there is no other location

- **Product:** Alma
-

Description

The "Skip location" button in the pick from shelf list should only be displayed if there is at least one other location. However, we see the "Skip location" button although all items are in one location.

Resolution

The differentiation works per holding record. If items in the same location belong to different holding records, the "skip location" button will be displayed as Alma does not check if these holding records are for an identical location.
