## Problems with the creation of Accession Number Sequences

---

### Question

We added a large number of Accession Numbers Sequences and saved them, but the Sequences have been replaced by the value -1 after some time. Why?

### Answer

When you're creating an Accession Number Sequence, this sequence needs to be saved in a specific table in the database to enable the process behind:

Every time you're assigning a new Accession Number, the system needs to check the last assigned number and create a new sequence, based on the configuration details like library, location, method, and prefix.

Creating a large number of accession number sequences one after the other might cause the above problem: the sequence has not been saved correctly in the database, but the "error" value -1 has been added to identify the problem.

To resolve this issue, the sequence needs to be removed and recreated.
