
How to remove unused Java JDK from server ?

- **Product:** Rosetta
 - **Product Version:** 7.0
-

Question

How to remove unused Java JDK from server ?

Answer

1. SSH as 'dps' user.
 2. Identify the current Java JDK version Rosetta is configured to use:
 - `ll /exlibris/dps/d4_1/product/local/java`
 3. Identify the current Java JDK version the current Rosetta service is running from:
 - `jps -v | grep -i jps`
 4. When Rosetta service from step #3 is running from the same JDK folder found in step #2, then it's reasonable to assume that it's safe to delete any other 'jdk*' folder of other versions found in the server (found under '/exlibris/product/' folder).
-

Note

The server might have 3rd party app/s running on the servers that uses Java JDK deployed by Rosetta SP and that isn't currently being used by Rosetta.

Please check for such dependencies before deleting any Java JDK.
