
Change the "no item information" text in WebVoyage

- **Product:** Voyager
 - **Relevant for Installation Type:** Multi-Tenant Direct, Dedicated-Direct, Local, TotalCare
-

Question

How do we change the "no item information" text in the Tomcat WebVoyage record display?

Answer

This text is set in the webvoyage.properties file; webvoyage.properties contains the variable in the following stanza (it's the "page.searchResults.item.status.noItemInfo=" variable):

```
#####  
# New search results item status  
#####  
page.searchResults.item.status.noHoldingsAvailable=no holdings available  
page.searchResults.item.status.noItemInfo=no item information  
page.searchResults.item.status.available=available  
page.searchResults.item.status.unavailable=not available  
page.searchResults.item.status.multipleItemsAvailable=multiple items available  
page.searchResults.item.status.multipleHoldingsAvailable= multiple holdings available  
page.searchResults.item.status.noCallNumber=No call number
```

Additional Information

If you can login to the server directly, you can use the following search from the command line to find system messages and other strings:

```
find . -type f -exec grep -il "no item information" {} \;
```

In the above example "no item information" is the *case-sensitive* string being searched for.

What this "grep" command does is find a list of all files below whatever directory you're in (so make sure you run it from a skin directory or lower, otherwise it may take a long time to run!),
