

## How to Suppress Physical Locations

- **Product:** RapidILL
- 

If you need to suppress specific locations from your sets, you can remove them from the Rapid publishing by using a normalization rule on the publishing profile. For example, if LOC\_A, LOC\_B and LOC\_C are the codes of locations that you do not want to include in the export to Rapid, you can use a rule such as the follows:

```
rule "remove suppressed location"
when
  (TRUE)
then
  removeField "954" if (exists "954.{*,*}.r.LOC_A")
  removeField "954" if (exists "954.{*,*}.r.LOC_B")
  removeField "954" if (exists "954.{*,*}.r.LOC_C")
end
```

This will effectively remove all these locations from the Rapid file.

For more information on setting up normalization rules see the following links:
